Your Comprehensive Toolbox

Measure, Inspect, and Simulate—All with One Software

VGSTUDIO MAX is your tool for identifying the most important 3D printing defects—from raw material to the post-processed end product. Perform powder and meltpool data analyses, take dimensional measurements of all surfaces—even if they are inside your additively manufactured part—and find defects of all shapes and sizes.

Powder Analysis

Powder is the base for many additively manufactured parts. The size and shape distribution of new and recycled powder particles influences the build process: it affects how powder gets distributed, influences the melt process, and can cause defects in the final part. With VGSTUDIO MAX, you can analyze grain contaminations, trapped air, grain sizes, and shapes – automatically for tens of thousands of particles.

Dimensional Measurements

Dimensional variations also occur in additively manufactured parts, which can lead to complex warpage. VGSTUDIO MAX gives you a full suite of measurement tools ranging from complex alignments to customizable measurement reports. Dimensions and GD&T analyses can be automated and applied to CT and mesh data. Together with 3D comparisons, wall thickness, and surface profile analyses, VGSTUDIO MAX provides full first article inspection capability, helping to certify your additive manufacturing process. VGSTUDIO MAX can also measure geometries resulting from 3D printing simulations, which helps you choose the right parameters for your 3D printing job.

Meltpool Analysis

The meltpool data delivers information from every build layer, starting right from the melting process. With VGSTUDIO MAX, you can 3D visualize the images generated by your additive manufacturing system's meltpool monitoring, analyze it, and compare it to the part's CT data. When process irregularities are detected, you can check the part quality in the CT results.

Porosity and Defect Inspection

Metal printing based on powder comes with challenges like voids, porosity, and cracks in the final product. With VGSTUDIO MAX, you can identify individual voids and inclusions and determine their sizes and shapes. Filtering of the defects by properties such as sphericity, compactness, or distance to surface allows you to distinguish between defect formation mechanisms.

Structural Mechanics Simulation

VGSTUDIO MAX enables you to perform structural mechanics simulation (SMS) directly on CT scans. Loads and constraints are applied to the CT scanned model, not just the CAD file. Stress concentrations due to geometrical flaws and pores can be simulated and visualized without volume meshing.

Volume Meshing

For simulation in third-party software, high-quality tetrahedral volume meshes representing the actual geometries and internal defects of the printed parts can be generated. Without intermediate surface meshing, this will avoid the loss of geometry information. Each cell of the generated volume mesh can be loaded with additional information required for simulation, such as porosity volume fractions, gray values (e.g., melt-pool data), fiber orientations, and fiber volume fractions.

Why CT?

The Most Reliable Technology for 3D Inspection

Additively manufactured products need to be thoroughly inspected to be certified for high-risk use cases. Computed tomography (CT) is the most reliable technology for identifying 3D printing defects and enabling the best possible 3D printing quality.

Because CT reconstruction produces a complete representation of a component in 3D from a large number of 2D X-ray images, CT allows the user to draw conclusions on the external and internal structures of a component and its material properties. Thus, CT can answer more complex questions than, for example, tactile or optical inspection methods.

With its fully integrated CT reconstruction function, Volume Graphics offers a seamless connection to the comprehensive analysis and measurement functions of its software.

Moreover, the software works equally well with different CT systems from different manufacturers. Most major CT system providers sell Volume Graphics software together with their hardware. In addition, we rely on a worldwide network of distributors to serve our customers around the globe.
